For machines with sufficient space between coupling
halves, fixtures can be mounted such that the dial
indicators are in direct contact with the coupling or the
shaft. In this case, the alignment can be performed with the
shafts un-coupled.

[Face Dial Indicator Readings and Angular Misalignment](#)

The face dial indicator is mounted parallel to the shafts
with the plunger making axial contact on a coupling hub.
The face indicator is used to measure coupling gap
differences. To determine vertical coupling gap difference,
the face indicator is set to zero at a vertical position (12:00
or 6:00) and rotated 180 degrees. To determine

[Dial Indicator Alignment](#). There are two commonly use
methods to align rotating machine shafts using dial
indicators. Rim-Face Method . When using a rim-face
method, one measurement is taken on the rim of the

is taken on the face of the coupling to determine shaft
angularity. This method often requires the machines to be
uncoupled to

If the face dial contacts the coupling face directly, ensure the plunger of indicator contacts the coupling near its outer edge. Ensure fixtures are mounted at a position where rotation is possible. It is desirable to have 360 degrees of rotation.

Understanding Shaft Alignment: Basics - Efficient Plant

What is shaft alignment? This number can be deceiving depending on the swing diameter of the face dial indicator or the diameter of the coupling being measured. In fairness, it should be noted that the tolerances offered by coupling manufacturers are to ensure the life of the coupling with the expectation that the flexible element will fail rather than a critical machine component. If this

Dial Indicator Alignment Procedure

The procedure for doing reverse dial indicator alignment is not a difficult one. There are several steps which need to be taken for a successful alignment job. Step 1. Familiarize with terms, techniques and procedure. *follow all safety rules and procedures . Step 2. Learn about the machine you are aligning. Visually check coupling, pipehangers, base bolts, coupling spacing etc. Check for

Exercise 2-2 Gearbox, Coupling, and Alignment - Lab-Volt

Coupling and alignment with the generator. Alignment procedure. More information about the gearbox Gear ratio You already know (as the names indicate) that the high-speed shaft runs faster than the low-speed shaft. In fact, the gearbox provides a ratio of 38:45 between these rotational speeds. Therefore, a low-speed shaft rotating at 47 RPM will drive the high-speed shaft at 1800 RPM. An
