Speed control methods of DC motor | electrical4u.com

Speed of a dc motor is directly proportional to the back emf  $E_b$  and  $E_b = V - I_a R_a$ . That means, when the supply voltage  $V$  and the armature resistance  $R_a$  are kept constant, speed is directly proportional to the armature current  $I_a$ . Thus, if we add a resistance in series with the armature,  $I_a$  decreases and, hence, the speed also decreases. Greater the resistance in series with the armature, greater the decrease in speed.
