Although the injection molding machine's cycle ends on Step 5, the process continues. Periodically the machine operators, or robots separate the usable parts from the left over runner.* The runner is the pathway that the plastic takes to fill the mold cavity. In many cases the runners are ground and recycled to reduce costs and environmental impact. The usable parts are then weighed, counted and packaged for assembly or shipping.

The process begins with the mould being clamped together under pressure to accommodate the injection and cooling processes. Injection the molten thermoplastic material, which has been melted by pellet form in the barrel of the machine, is injected under pressure into the mould through either a screw or ramming device.

Injection moulding - Wikipedia

Injection moulding is a manufacturing process for producing parts by injecting molten material into a mould. Injection moulding can be performed with a host of materials mainly including metals, (for which the process is called die-casting), glasses, elastomers, confections, and most commonly thermoplastic and thermosetting polymers.
